Executive Fleet & Operations Dashboard

Management Summary Report

1. PROBLEM STATEMENT

Our fleet management operation faces three interconnected challenges that directly impact revenue generation and asset efficiency:

- Asset Underutilization Crisis**

With **7,701 vehicles** in the fleet, **51.95%** remain unproductive (idle: 3,228 | workshop: 644 | withdrawn: 129), creating depreciation costs without generating revenue. Current inventory turnover stands at **0.64**, meaning vehicles complete less than one full cycle per month. This slow conversion rate indicates assets are sitting idle for extended periods, accumulating carrying costs while their market value deteriorates.
- Operational Bottlenecks**

Multiple friction points create a **31-day** average delay from vehicle reception to driver assignment, compounded by a **15-day** GPS-to-driver assignment gap. Most concerning is the **196-day** workshop turnaround time—vehicles spend over six months in service, removing them from revenue generation and creating a massive operational drag. These systemic delays prevent rapid fleet deployment and efficient asset utilization.
- Collections Risk Exposure**

Default risk is critically elevated, with **34.96%** of the portfolio over 7 days past due and an average risk score of **30.6/100**. More alarming, **3,334 vehicles (43% of fleet)** trigger early warning indicators due to prolonged status durations or unresolved operational issues. This suggests operational instability is directly contributing to collection challenges, creating a feedback loop where delayed assignments increase default probability.
- Business Impact:** Over half the fleet generates zero revenue while incurring \$X daily depreciation. Extended workshop cycles and assignment delays result in \$Y lost revenue days annually. Elevated collection risk threatens \$Z in potential write-offs. Combined, these inefficiencies erode margins by an estimated XX% annually.

2. APPROACH

The Executive Fleet & Operations Dashboard provides real-time visibility and diagnostic capabilities across three integrated domains:

- Fleet & Asset Health Analytics**
 - Fleet composition tracking** segments 7,701 vehicles by productive (3,700) vs. unproductive (4,001) status, enabling proactive reallocation of the 3,228 idle vehicles before depreciation accelerates
 - Geographic inventory heatmaps** identify PARK-level surpluses and deficits across Mexico's states for redistribution planning
 - Inventory turnover monitoring** (current: 0.64) measures conversion efficiency with monthly trending to detect seasonal patterns and capacity constraints
- Operational Deep Dive**
 - Cycle time metrics** quantify 31-day assignment lag, 15-day GPS gap, and 196-day workshop turnaround across brands, models, and locations—exposing which vehicle configurations drain operational capacity
 - Actionable alert lists** surface vehicles requiring immediate intervention based on prolonged workshop age (644 in workshop, many exceeding 200+ days)
 - Comparative analysis** reveals which brands and PARKs demonstrate efficiency versus those creating systematic delays
- Collections Risk Management**
 - Risk distribution visualization** segments portfolio by default probability bands for targeted collection effort—addressing the 35% delinquency rate
 - Early warning system** identifies 3,334 vehicles (43% of fleet) with prolonged status durations, unresolved operational issues, or delinquency indicators before they escalate to critical default
 - Correlation analysis** connects operational instability (frequent status transitions) with inventory time and risk scores, enabling root-cause intervention rather than reactive collections

Data Foundation: The dashboard integrates daily collections risk snapshots, current fleet health status, monthly inventory turnover, and vehicle-level operational metrics from production data marts, ensuring decision-makers access consistent, trustworthy insights.

3. IMPACT

The dashboard enables data-driven interventions that directly improve financial performance:

- Improved Asset Productivity**
 - Fleet managers can reassign idle vehicles (3,228 currently idle) before depreciation accelerates, targeting reduction of unproductive fleet from 52% to <35% within 90 days
 - Geographic rebalancing based on PARK inventory heatmaps minimizes both surplus (carrying costs) and shortage (lost revenue) scenarios
 - Improving inventory turnover from 0.64 to 1.0+ would enable 156% more vehicle assignments per year from the same fleet size
- Accelerated Revenue Generation**
 - Reducing reception-to-assignment from 31 days to <15 days adds 16+ revenue days per vehicle annually
 - Eliminating the 15-day GPS-to-driver gap unlocks immediate assignment capability for vehicles technically ready but administratively delayed
 - Reducing workshop turnaround from 196 days to <30 days could return 500+ vehicles to productive status, equivalent to expanding revenue capacity by 6.5%
- Risk-Adjusted Collections Strategy**
 - Collections teams can focus on the 35% of vehicles over 7 DPD and the 3,334 early-warning vehicles, allocating effort proportionally to risk exposure
 - Early intervention on prolonged-status vehicles (43% of fleet) prevents escalation from operational issues to critical delinquency
 - Understanding the operational-instability-to-risk correlation allows preventive action—fixing assignment delays before they become collection problems

Measurable Outcomes:

- Revenue Impact:** 16 additional revenue days per vehicle × 7,701 fleet × \$X daily rate = \$Y annual revenue recovery
- Cost Reduction:** Reducing unproductive fleet from 52% to 35% saves \$Z in depreciation and carrying costs
- Risk Mitigation:** Reducing 7+ DPD rate from 35% to <20% prevents \$W in potential write-offs
- Capital Efficiency:** Improving turnover from 0.64 to 1.2 generates 87% more throughput without fleet expansion

Strategic Value: This integrated view transforms fleet management from reactive firefighting to predictive optimization, aligning asset deployment, operations, and collections around a unified performance framework.

4. RECOMMENDATIONS TO IMPLEMENT

IMMEDIATE ACTIONS (0-30 Days)

- A. Workshop Crisis Response**

Problem: 196-day average turnaround is removing 644 vehicles from productive use

 - Launch workshop audit:** Identify the top 100 vehicles by workshop age (200+ days). Classify as: (1) awaiting parts, (2) awaiting approval, (3) service in progress, (4) administrative hold
 - Implement expedited release protocol:** For vehicles in administrative hold, establish 48-hour approval SLA
 - Brand-specific intervention:** The dashboard shows workshop turnaround by brand—engage with manufacturers showing 250+ day averages to negotiate expedited parts or buyback options
 - Target:** Reduce workshop turnaround to <90 days, returning 300+ vehicles to productive status
- B. GPS-to-Driver Assignment Acceleration**

Problem: 15-day gap delays assignment for vehicles that are technically ready

 - Daily GPS assignment review:** Implement daily standup to clear GPS assignment backlog for vehicles with GPS installed but no driver assigned
 - Pre-assign GPS to incoming inventory:** Install and assign GPS during the reception-to-assignment window rather than after assignment decision
 - Target:** Eliminate GPS assignment gap to <3 days, adding 12 revenue days per vehicle
- C. Idle Inventory Redeployment**

Problem: 3,228 vehicles (42% of fleet) sit idle while some PARKs report shortages

 - Use PARK Inventory Heatmap:** Identify top 5 surplus locations and top 5 deficit locations
 - Weekly reallocation:** Transfer 50-100 idle vehicles weekly from surplus to deficit PARKs
 - Priority assignment:** Establish business rule—no new purchases until idle inventory <20%
 - Target:** Reduce idle fleet from 3,228 to <1,500 within 60 days
- SHORT-TERM INITIATIVES (30-90 Days)**
- D. Reception-to-Assignment Process Reengineering**

Problem: 31-day average cycle time delays revenue generation

 - Process mapping workshop:** Document end-to-end reception-to-assignment flow, identifying handoff delays, approval bottlenecks, and documentation gaps
 - Parallel processing:** Move GPS installation, inspection, and contract preparation to parallel workflows rather than sequential gates
 - Assignment authority:** Delegate assignment approval to PARK managers for standard vehicle configurations (no escalation required)
 - Target:** Reduce reception-to-assignment to <15 days, doubling assignment velocity
- E. Early Warning Vehicle Intervention Program**

Problem: 3,334 vehicles (43% of fleet) in early warning status due to prolonged or unresolved conditions

 - Triage protocol:** Collections team reviews Early Warning table daily, categorizing vehicles by root cause (operational vs. payment issues)
 - Cross-functional task force:** Weekly meetings between Fleet Ops and Collections to resolve vehicles stuck in prolonged statuses
 - Status transition limits:** Implement automated escalation when vehicle exceeds 30 days in any single status without resolution
 - Target:** Reduce early warning vehicles from 3,334 to <1,500 (20% of fleet)
- F. Collections Risk Stratification**

Problem: 35% of vehicles >7 DPD; resources spread thin across all accounts
